

1. What is the DOM in JavaScript and why is it important?

Ans: DOM stands for Document Object Model in JavaScript. It is very important because it is used to manipulate whole HTML document and each element in the HTML of the Website.

2. Explain the difference between: - innerText vs textContent - innerHTML vs outerHTML?

Ans:

innerText	textContent
It returns all text inside an element.	It returns only visible text if display is none it will not show.
It gives the text exactly as it's appeared in the DOM means without styles.	It is slower than innerText it is depended on styles.

innerHTML	outerHTML
It returns all text inside an element.	It returns only visible text if display is none it will not show.
It gives the text exactly as it's appeared in the DOM means without styles.	It is slower than innerText it is depended on styles.

3. What are different ways to select HTML elements using JavaScript? Give examples.

Ans: Imagine you have **h1** element in your HTML that contains **id = 'heading'** and **class = 'headingClass'** and You want to select it.

You can select it by using various methods:

- `document.querySelector('h1')`
- `document.querySelectorAll('h1')`
- `document.getElementById('heading')`
- `document.getElementsByClassName('headingClass')`

4. What is the difference between `classList.add()` and `classList.toggle()`?

<code>classList.add()</code>	<code>classList.toggle()</code>
Adds one or more CSS classes to an element.	Adds the class if it's not present.
If the class is already present, it won't add it again.	Removes the class if it's already present. Works like an ON/OFF switch.

5. How can you change the CSS style of an element directly using JavaScript?

Ans: I can change the CSS style of an element directly using JavaScript by **targeting** the element then use **.style** method to style element.
